YASKAWA Electric, since its establishment in 1915, has always supported the leading business of age by transforming itself from “YASKAWA as a motor manufacturer”, “YASKAWA as an automation company” to “YASKAWA as a mechatronics company” based on its management philosophy of “contributing to the evolution of society and the welfare of mankind through the performance of its business.” We are committed to contributing to the further evolution of our society by strengthening our core business of “servo motor”, “controller”, “AC Drives” and “industrial robots” and by offering customers new solutions using these core technologies to the full.

Since releasing a three-phase induction motor, YASKAWA developed its own sophisticated system control, management technology, and an extensive array of drive and motion control technology accumulated in the process automation and factory automation fields. Based on these developments, we created products and technology for semiconductor manufacturing equipment, industrial robots, and plants, winning high customer satisfaction.

We are providing not only products based on the concept of “Mechatronics” but also the technical knowledge and support to fulfill each customer’s needs and thereby increase their satisfaction. “Mechatronics” as adopted by YASKAWA, means integrating our products into others resulting in higher efficiency.

Since being founded in 1915, Yaskawa Electric has set ‘electric motors and their applications’ as its business domain and supported the leading-edge industries of the age. In order to engage in business with its own technology, the company established a creed of ‘becoming a technology-centered company,’ proposed the concept of ‘mechatronics.

Our business hubs are located in 30 countries around the world including Japan, and the production bases are located in 12 countries. We operate a glocal*2 business which is adapted to each region’s characteristics. Yaskawa’s technologies, products and services are enjoying high reputation and great trust from customers worldwide.

In recent years, expectations for our solutions provided with servos and robots are increasing in response to challenges such as automation or labor saving against the backdrop of workforce shortage and rise of labor cost mainly in China. With the industrial advancement, manufacturing industries all over the world are undergoing rapid changes including the realization of Industrie4.0*3, the utilization of Internet of Things (IoT)*4 or Artificial Intelligence (AI).
